

How to create Entities from database schema using doctrine in laravel ?

Step 1. Run this command php

```
artisan doctrine:convert:mapping --from-database annotation app/Entities
```

This command will read database schema and create the entities with annotation mapping in my ./app/Entities location

Step 2.

```
php artisan doctrine:generate:entities --generate-annotations= "true" app/Entities
```

This command will create entity classes with getter and setter methods from your mapping information.

"app/Entity" : This is your entity file path.
